

MYCORMAX[®]

OMRI
Listed

BIOLOGICAL
ROOT INOCULANT

Mycormax is a biologically-based product containing spores, colonized root fragments, and other propagules of seven beneficial root colonizing fungi species. Mycorrhizal fungi live on the roots of plants in a symbiotic relationship. These fungi help plants absorb nutrients and water and physically protect the roots from penetration by disease-causing soil pathogens. **Mycormax** comes in easy-to-use water soluble “teabags”. Just drop in the recommended number of bags into the planting hole, place the plant, and cover with soil to complete the application. Moisture will be drawn from the soil to activate the fungi to build a sphere of protection around the plant roots.

Mycormax rebuilds soil populations of beneficial mycorrhizal fungi after soil fumigation or other events that reduce populations.

Mycormax works on established vineyards and orchards too. It is recommended that **Mycormax** be applied once a year to maintain the mycorrhizal population.

Mycormax is certified for use in commercial organic farming and is safe to use in all settings such as gardens, orchards, vineyards, homes, and yards.

Benefits of Using Mycormax

- Physical barrier against root pathogens and nematodes
- Increased absorption of essential nutrients
- Natural
- Non-toxic
- Certified for use in organic food production
